

# SEAUPG 2003 CONFERENCE

## Planning for the 2002 Design Guide

Southeast Asphalt User/Producer Group Mtg.  
 Hilton Head Island, South Carolina  
 Harold L. Von Quintus, P.E.  
 November 20, 2003

2002 Design Guide

## Presentation Overview

- Points to Remember
- Questions/Products
- Plan to Address Inputs & Local Issues

2002 Design Guide

### Point 1!

Design Guide **FAR EXCEEDS** 1993 AASHTO Design Guide in all aspects, but simplicity

- The method is based on tools that **EQUAL OR EXCEED** state-of-the-art!

2002 Design Guide

### Point 2!

The hierarchical design procedure allows a user to use the Guide with **NO** major investment

2002 Design Guide

### Point 3!

It's a design-analysis procedure with **Global**

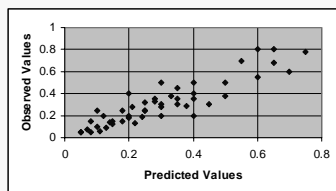

- Correlations to estimate selected inputs.
- Default values.
- Calibration factors – **LTTP**

2002 Design Guide

### Point 4!

The accuracy or error of the new method **HAS BEEN** quantified. How accurate is our existing pavement design procedure – the 1993 AASHTO Design Guide?

2002 Design Guide

Hilton Head Isle, South Carolina - November 20, 2003

# SEAUPG 2003 CONFERENCE

**Point 5!**

Design Guide:  
Thickness design process

*BUT* can be used to determine/evaluate design features

**Flexible Pavements**

- Asphalt binder grade
- HMA mix type
- Air Voids/Density
- Drainage

**Example:  
Effect of  
Air Voids**

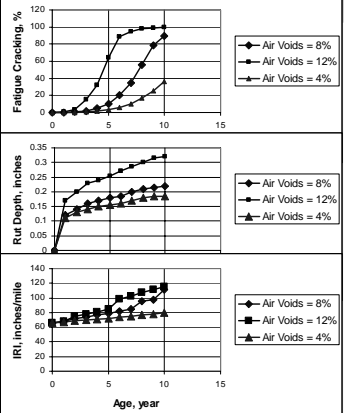

**6" HMA**

12" Crushed Stone

12" Aggr. Subbase

A-5 Soil

**2002  
Design Guide**

**Point 6!**

It Ties Together:

- Structural Design
- Mixture Design
- Construction

Making sure that  
the design criteria  
have been meet  
or exceeded.

Material and  
Construction  
Specifications

**Questions & Products**

**2002  
Design Guide**

**Questions & Products**

What do I need & how do I use the software?

- Management video
- Guide text & appendices
- User's Manual in support of software
- Training course on software execution

**Questions & Products**

How accurate are the predictions to my local conditions & materials?

- Expert input mode
- Local calibration procedure
- Test procedures (lab & field) to determine inputs.

# SEAUPG 2003 CONFERENCE

## Inputs & Local Issues

What can I do to get started?

1. Accumulate basic data
2. Compare to traditional designs
3. Conduct sensitivity analysis

- Design Criteria
- Traffic
- Materials/Soils
- Climate
- Rehab. – Pavement Evaluation

## Input Levels 1, 2, 3

You want me to determine **WHAT????**

Thermal conductivity, Poisson's ratio, Creep compliance, Dynamic modulus, etc.

2002 Design Guide

## Design Criteria

- Bottom Initiated Fatigue Cracks
- Surface Initiated Fatigue Cracks
- Thermal Cracking
- IRI
- Total Rutting & HMA Rutting

## Truck Traffic

Truck volume distribution

Axle weight distribution

Truck Traffic Projections

2002 Design Guide

## Build Truck Traffic Library

Accumulate Traffic Data:

- Truck volumes
- Axle weights
- Regional & seasonal effects

1. AVC Data
2. WIM Data

2002 Design Guide

## Materials Testing: HMA Characterization

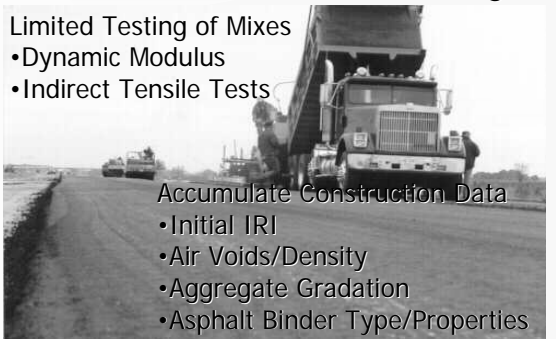

- Dynamic modulus, master curve
- IDT creep compliance master curve
- IDT strength
- Density/Air voids
- Aggregation Gradation
- Asphalt binder PG properties

# SEAUPG 2003 CONFERENCE

## Materials Testing: HMA Materials Library

Limited Testing of Mixes

- Dynamic Modulus
- Indirect Tensile Tests

Accumulate Construction Data

- Initial IRI
- Air Voids/Density
- Aggregate Gradation
- Asphalt Binder Type/Properties

## Materials Testing: Unbound Base/Soils

Resilient modulus, or Strength Values

- CBR
- R-Value, or
- Dynamic Cone Penetration

## Materials Testing: Unbound Base & Soils Materials Library

Accumulate Construction Data:

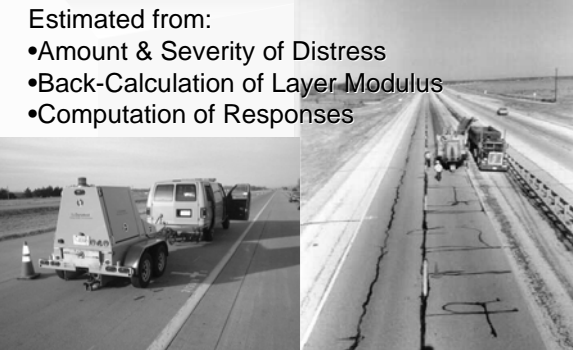

- Density/Moisture Content
- Gradation
- Atterberg Limits

Limited Resilient Modulus Testing

## Damage in Existing Structure

Estimated from:

- Amount & Severity of Distress
- Back-Calculation of Layer Modulus
- Computation of Responses

## Agency Implementation & Local Issues

Adopting 2002 Design Guide – ACCEPT AS IS?

Agencies with Implementation Plans

## 2002 Calibration-Validation Process

- Used **BEST** Available Data.
- No Materials Testing – Relied on existing databases for all inputs – LTPP.

Can we do better?

Input Element	Input Level		
	1	2	3
Material Properties	Lab Testing	Equations	"Guessed" Value

# SEAUPG 2003 CONFERENCE

## Implementation Issue:

Too much error?  
Applicability of error?

Are our design standards & materials similar to **LTPP** sites?

- Pavement types
- Rehab strategies
- Materials/Mixtures

➤ **Yes** – Confirm default values.

➤ **No** – Re-calibrate.

2002 Design Guide

## Implementation Issue

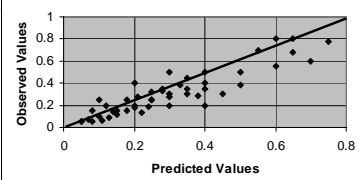

Remember point 1, no major investment is needed for Level 3 inputs, **BUT** you are going to get out of the program based on what you put into it!

2002 Design Guide

## Implementation Issue

Remember Point 4:  
All prediction models have errors;  
**BUT** where does the error come from?

$$Observed = Predicted \pm e_{Total}$$

2002 Design Guide

## Implementation Plan

Procedures to determine inputs – become equipped to do:

- Axle load spectra (TMG)
- Deflection testing & back calculation of layer modulus
- Repeated load/cyclic testing; materials characterization.

2002 Design Guide

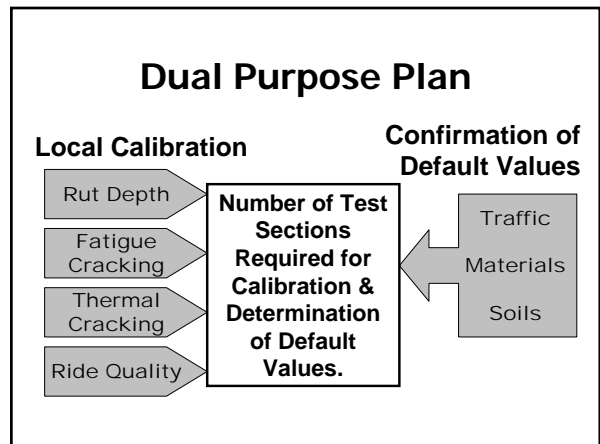

## Implementation Plan

Local confirmation of default values & calibration factors:

- Build library of material properties & traffic factors (Confirm Level 2 inputs)
- Build library of default values (Confirm Level 3 inputs)
- Use LTPP as a starting point.

2002 Design Guide

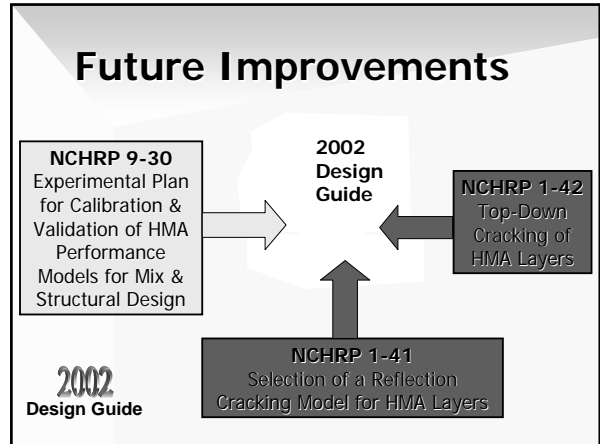

# SEAUPG 2003 CONFERENCE

## Implementation Plan, Other Issues & Topics:

- Comparison to conventional designs
  - Define the differences.
- Sensitivity of performance to design features
  - Identify the most sensitive design features.
- Resources and time for implementation
  - 4 to 5 years.

**1-37A Design Guide**

**2002 Design Guide**

## Future Improvements – NCHRP 9-30 Products

- M-E Database
- Experimental Plan & Factorial for Mix Characterization

**2002 Design Guide**

## In Summary:

- You can use the 2002 Design Guide using current practice.
- Will the errors or bias of the predictions apply to your conditions & materials?

A screenshot of the 2002 Design Guide software interface, showing a window titled 'Design Guide 2002' with a menu bar (File, Edit, View, Tools, Help) and a main content area displaying the NCHRP 2002 logo and project title.

**2002 Design Guide**

## 2002 Design Guide:

The future of pavement design.

A screenshot of the 2002 Design Guide software interface, showing a window titled 'Design Guide 2002' with a menu bar (File, Edit, View, Tools, Help) and a main content area displaying the NCHRP 2002 logo and project title.

**2002 Design Guide**

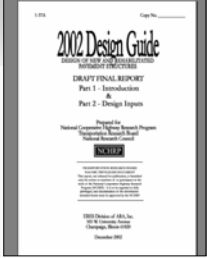

Thank you for your attention!

**2002 Design Guide**

# SEAUPG 2003 CONFERENCE

## Implementation Plan

- Training on design procedure
- Procedures to determine input parameters
- Calibration of software & field equipment
- Verification & confirmation of default values
- Calibration factors

**2002 Design Guide**

## Implementation Plan Focus

- Applicability of the methods & default values to my local conditions/materials

**Mix Size**

- 2" ← 19.0 mm
- 2 1/2" ← 25.0 mm

**Material properties. Recycling of materials. Innovative materials. Design features. Traffic features.**

## Other Implementation Products for Calibration

- LTPP database
- NHI Course 131064 – Introduction to Mechanistic-Empirical Design Procedures
- Agency test sections
- APT and ALT sites
- Test tracks – WestTrack, NCAT, MnRoads, etc.
- NCHRP 9-30, Experimental Plan for Validation of HMA Prediction Models

**2002 Design Guide**

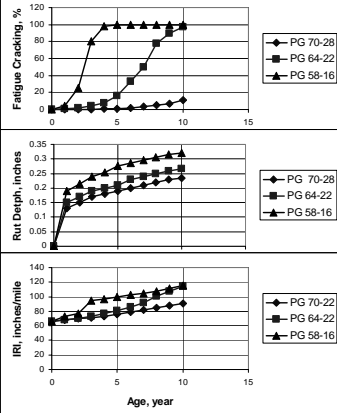

## Effect of Asphalt Binder Type

**6" HMA**

12" Crushed Stone

12" Aggr. Subbase

A-5 Soil

**2002 Design Guide**

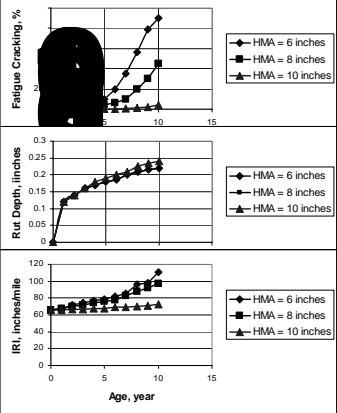

## Effect of HMA Thickness

**HMA**

12" Crushed Stone

12" Aggr. Subbase

A-5 Soil

**2002 Design Guide**

## Effect of Drainage Layer

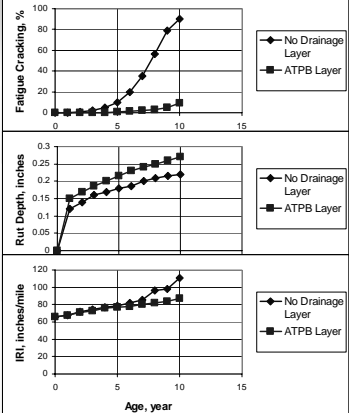

**6" HMA**

4" ATPB

8, 12" Crushed Stone

12" Aggr. Subbase

A-5 Soil

**2002 Design Guide**

Hilton Head Isle, South Carolina - November 20, 2003

# SEAUPG 2003 CONFERENCE

## Implementation Plan Focus

• Determination of the inputs.  
• Use of the software.

• Applicability of the methods & default values to my local conditions/materials.

**Mix Size**

- 2" → 19.0 mm Gap-Graded (SMA)
- 2 1/2" → 25.0 mm
- 3 1/2" → 37.5 mm

**In-place recycling.  
New materials.  
Design features.  
Traffic features.**

Reduce uncertainty by using level 1 inputs.

$$e_{Level1} \leq e_{Level2} \leq e_{Level3}$$

Input Element	Input Level		
	1	2	3
Material Properties	Lab Testing	Regression equations	Default; "Best Guessed" Value

## Components of the Error Term?

## Implementation Plan Topics

1. Training on design procedure.
2. Procedures to determine input parameters.
3. Obtain lab & field equipment.
4. Verification & confirmation procedure.
  - Default values
  - Calibration factors

**2002 Design Guide**

## Implementation Plan

Training & Communication are essential!

- > Structural Design
- > Traffic
- > Construction
- > Materials Characterization
- > Pavement Monitoring

**2002 Design Guide**

## Summary: Road Map of Implementation Plan Activities

```

    graph TD
      A[Phase I - Planning] --> B[Phase II - Initial Data Collection & Analyses]
      B --> C[Phase III - Annual Data Collection, Analyses, & Confirmation]
    
```
